

ASSESSMENT OF TOBACCO SMOKE-MEDIATED ATHEROSCLEROSIS IN MOUSE MODEL

C. Gary Gairola, Ph. D.

University of Kentucky

Lexington, KY

- 1. Models of human atherosclerosis**
- 2. Description of model used in our studies**
- 3. End points**
- 4. Measurement of atherosclerotic lesion**
- 5. Smoke studies**
- 6. Strengths and Weaknesses of the model**
- 7. Information needed for reduced risk assessment**

ANIMAL MODELS OF ATHEROSCLEROSIS

Two types-Diet-induced

-Genetically manipulated

Lipid or lipoprotein disorders

Develop Hyperlipidemia

Current Usage--genetically manipulated mice

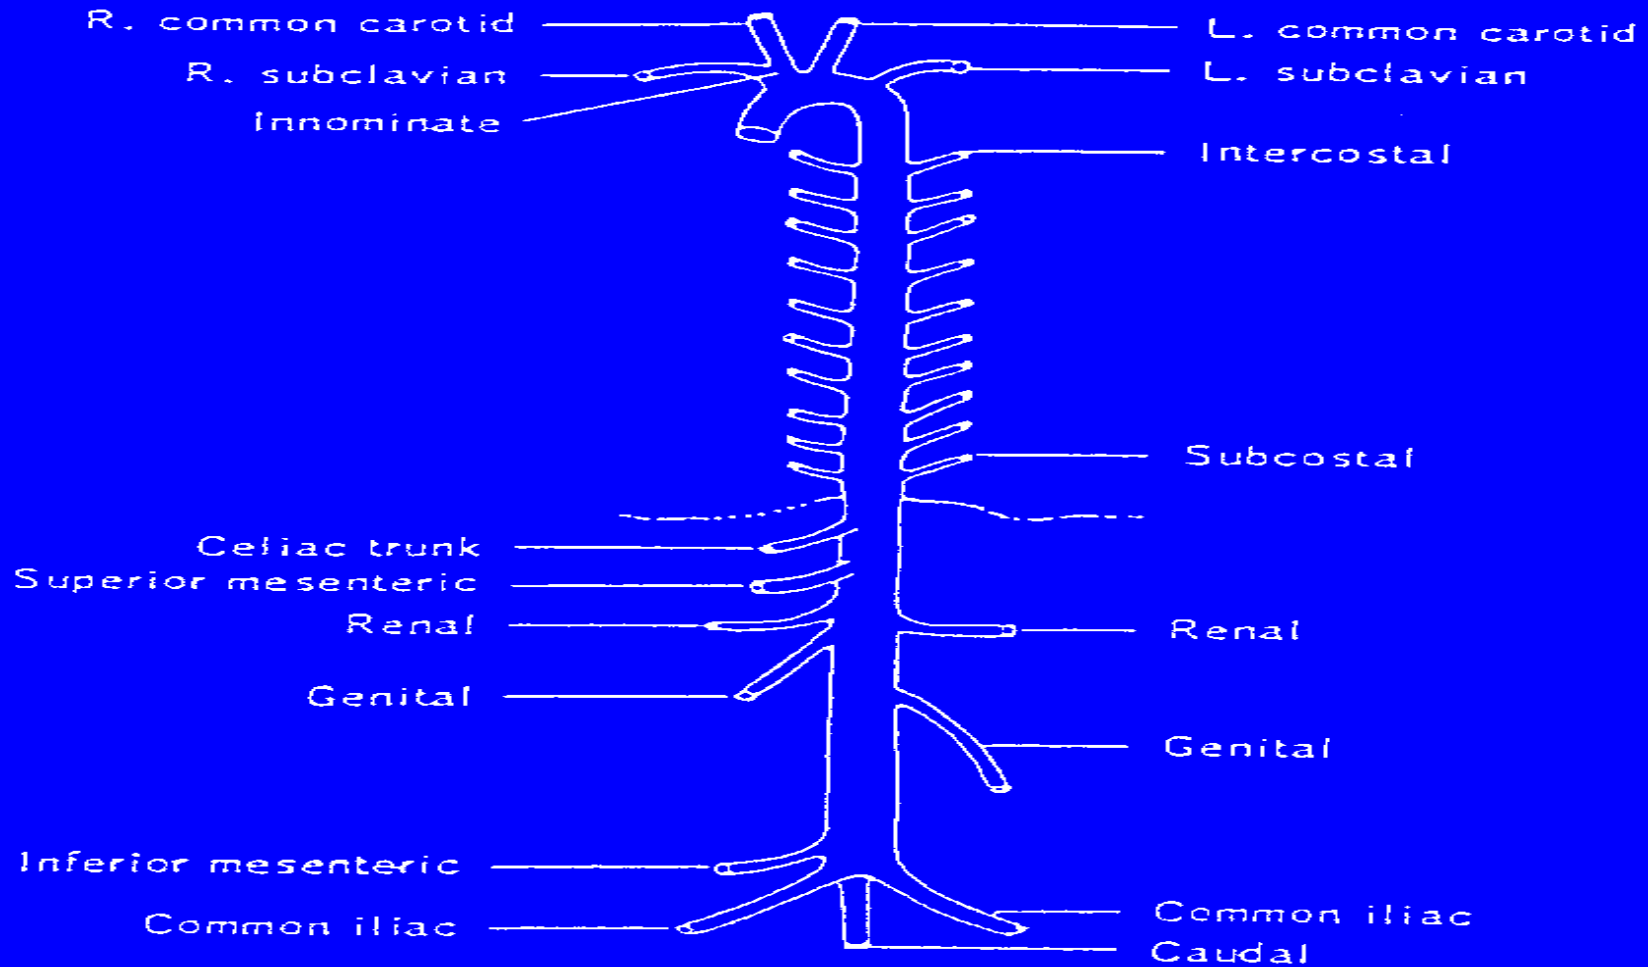

Most extensively used models:

apolipoprotein E or LDL-receptor- deficient mice

DIETS

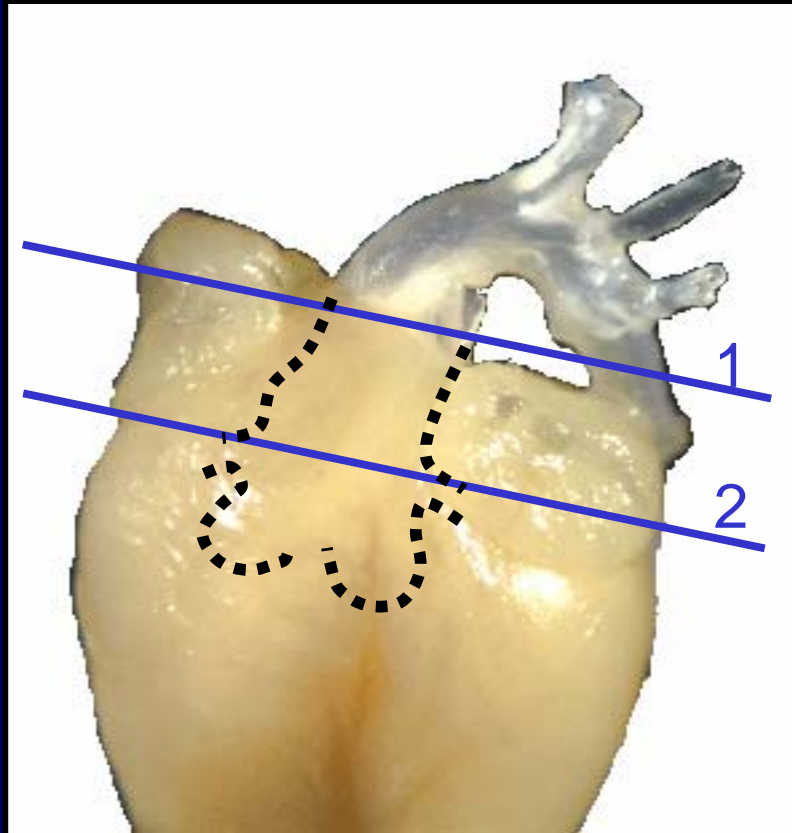

- Regular mouse chow
- High saturated fat/cholesterol diet
21% fat, 0.5-1.5% cholesterol

MOUSE AORTA

Drawing of the main arteries branching from the aorta.

Lesion Size Determination: Aortic Root

INTIMAL LESION AREA MEASUREMENT

- Aorta cleaned, opened and pinned
- Lesions traced under dissecting microscope
- Images captured with a digital camera for analysis by appropriate programs
- Planar measurements of the area

Quantification of Atherosclerotic Lesions En Face

ANIMAL MODEL USED IN OUR STUDIES

C57Bl-apolipoprotein E-knock out mice

LDLreceptor-deficient mice

Commercially available from

Jackson Laboratories, Maine

CHARACTERISTICS

- ApoE-deficiency induces hypercholesterolemia because the LDL/VLDL are not cleared.
- Animals develop atherosclerotic lesions on the intimal surface of the aorta which are formed all through the aortic tree.
- Time course dependent on diet.

END POINTS

- **lesion area**
- **plasma cholesterol**
- **aortic tissue cholesterol**
- **aortic constriction and relaxation ?**

SMOKE STUDIES

EXPERIMENTAL

- ApoE-deficient mice -- Two Groups-*Sham controls (SH) and Smoke-exposed (SM)*
- Exposures are in a whole-body exposure chamber to sidestream smoke from 1R4F cigarettes.
- Exposures are for 4 hrs/day, 5 days /week.
- Animals were sacrificed and plasma lipids and aorta examined.

University of Kentucky Research Cigarettes

WHOLE-BODY SMOKE EXPOSURE SYSTEM

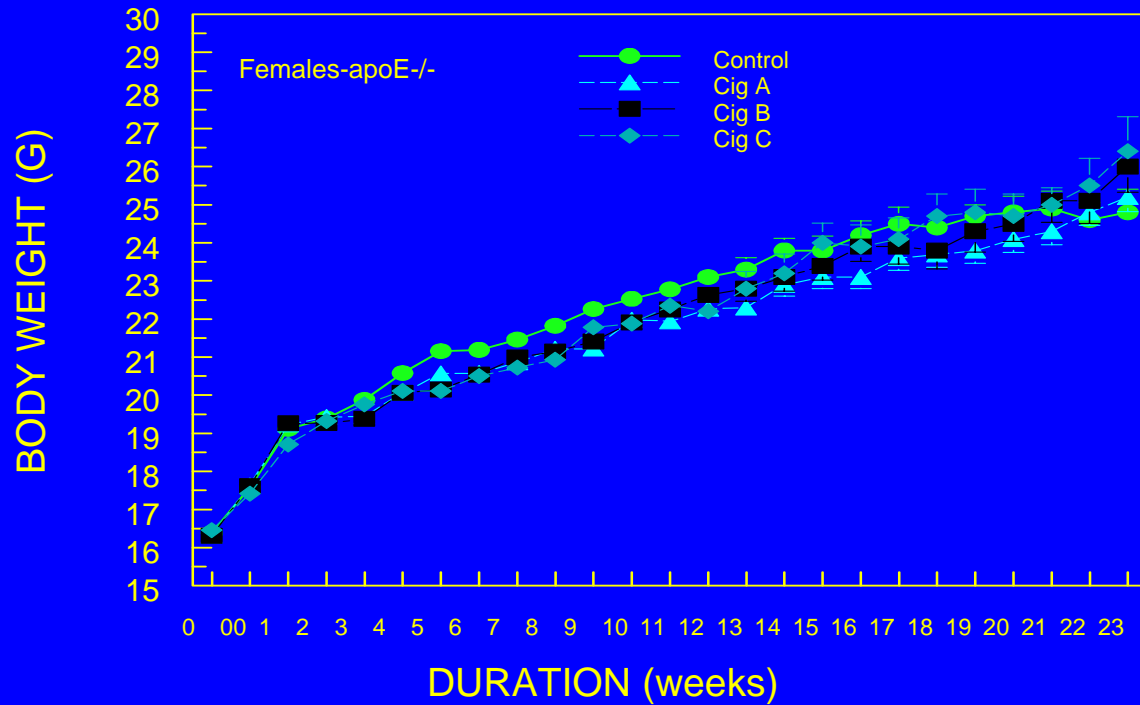

WHOLE-BODY CHAMBER FOR EXPOSURE OF RODENTS TO CIGARETTE SMOKE

Total Particulate Matter
 $32 \pm 4 \text{ mg/m}^3$

Body Weights of ApoE^{-/-} Mice

Lung Ethoxyresorufin-O-deethylase Activity

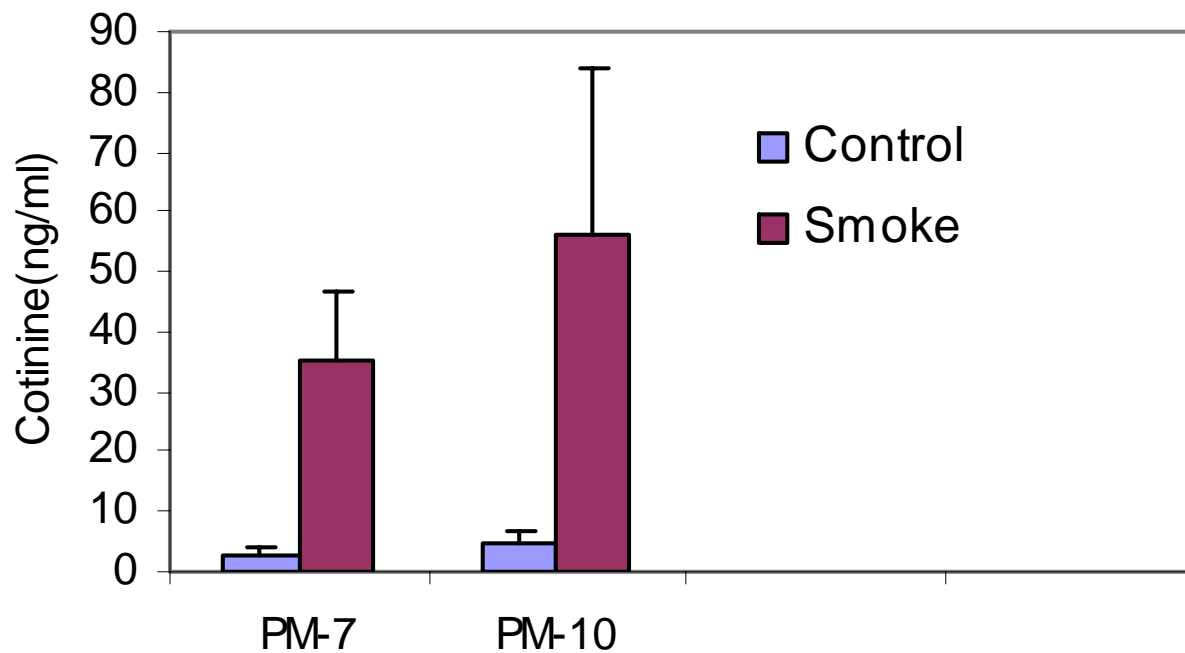

CYP1A1-PROTEIN LEVELS IN SMOKE-EXPOSED ApoE^{-/-} MICE LUNGS

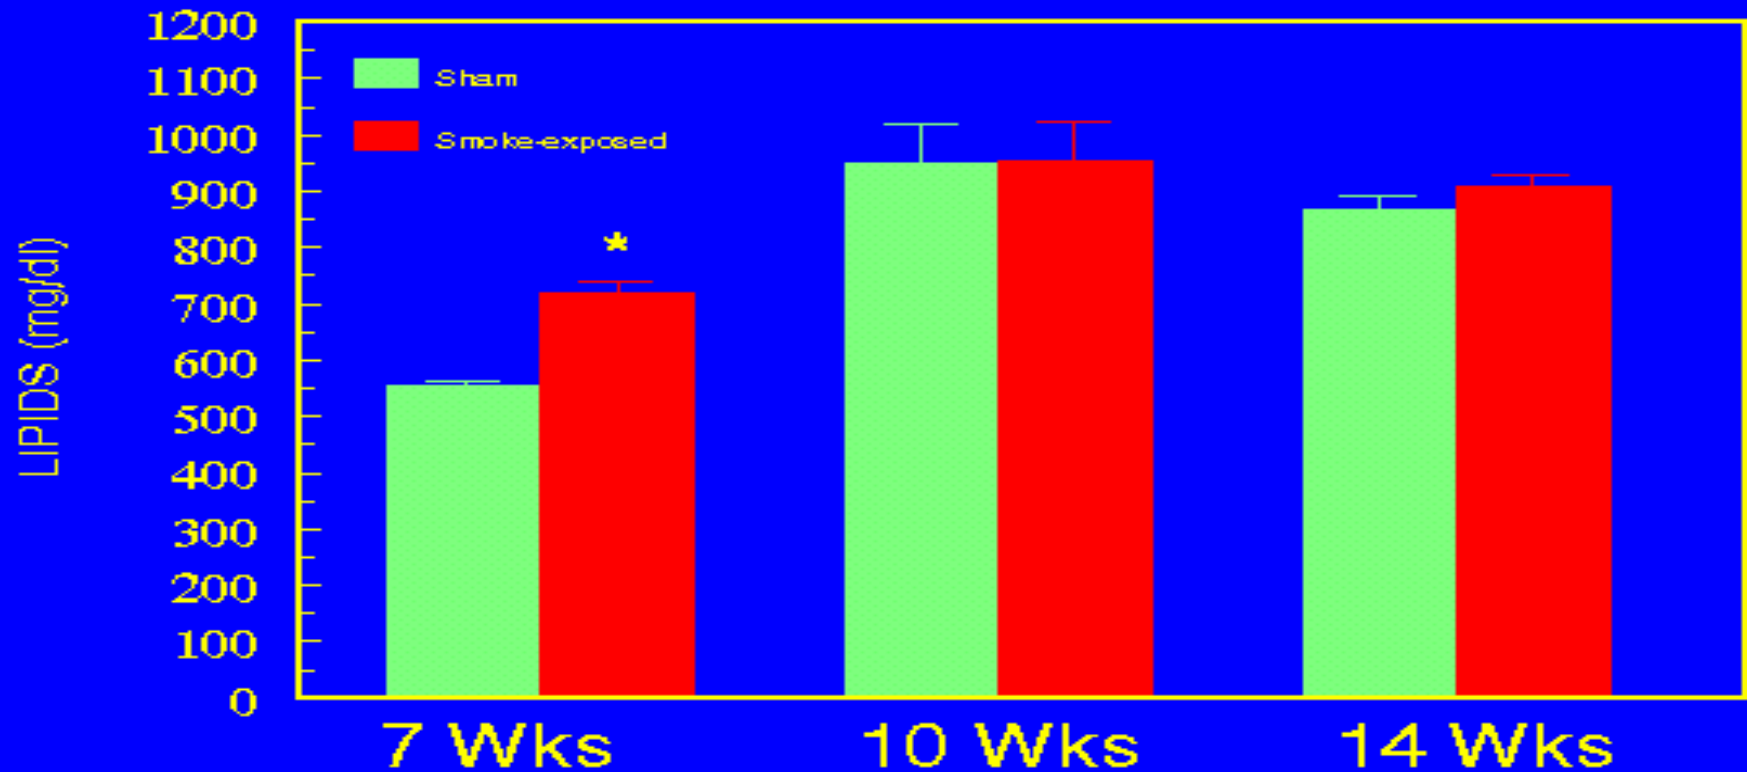

URINARY COTININE

CONTROL vs SMOKE apoE^{-/-} mice

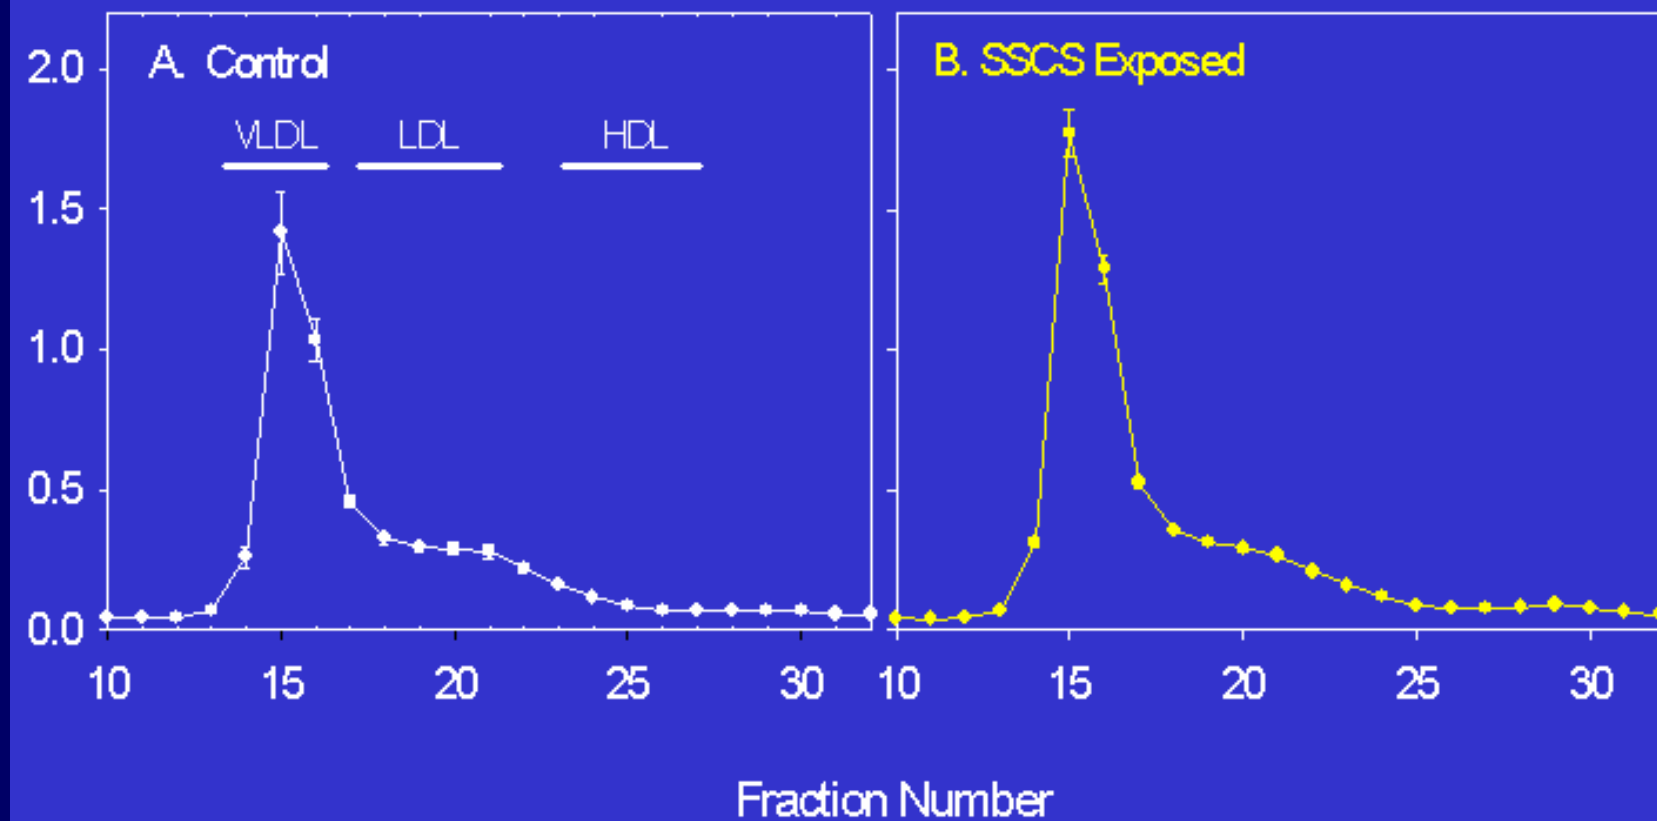

PLASMA CHOLESTEROL IN ApoE^{-/-} MICE

Sham vs Smoke-exposed

DISTRIBUTION OF LIPOPROTEIN-CHOLESTEROL IN PLASMA

ApoE^{-/-}-Mice: Control and Smoke-Exposed

En Face Comparison of Aortic Lesions

apoE^{-/-} Study

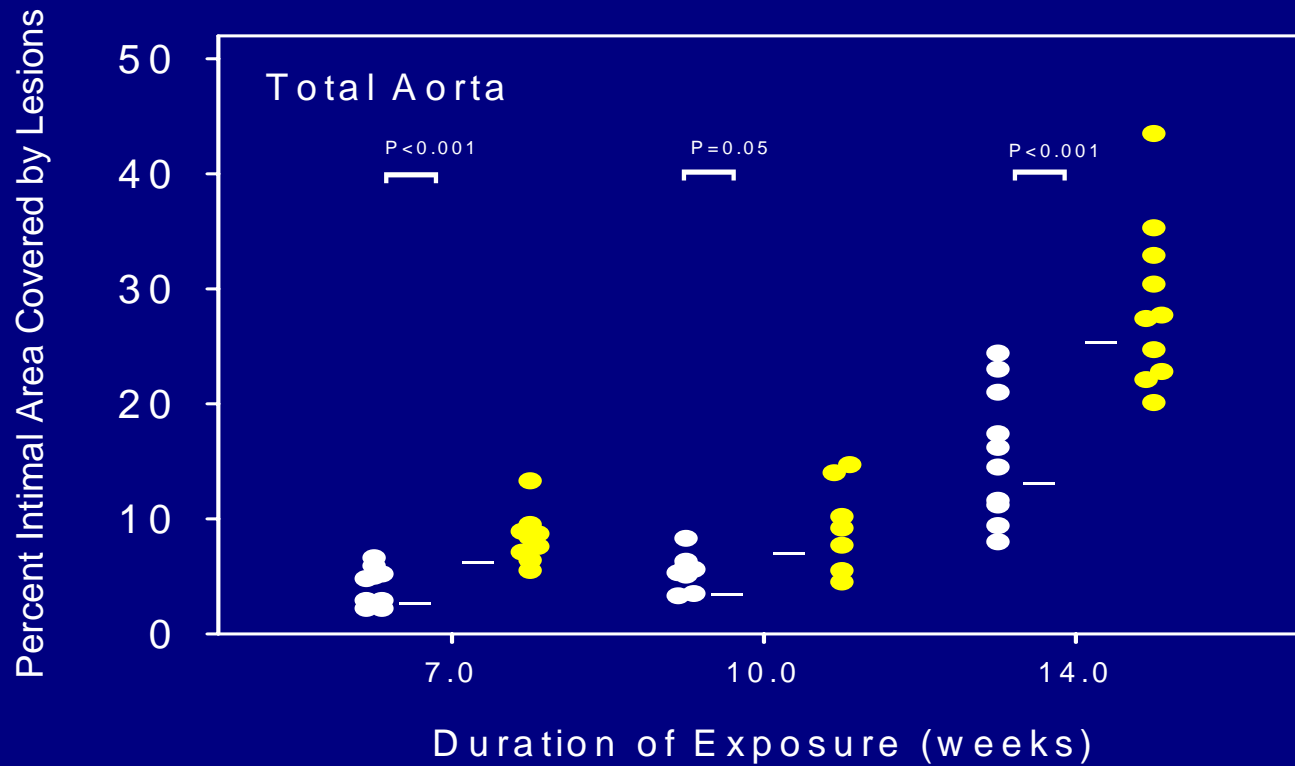

Control Mouse Aorta

Smoke-Exposed Mouse Aorta

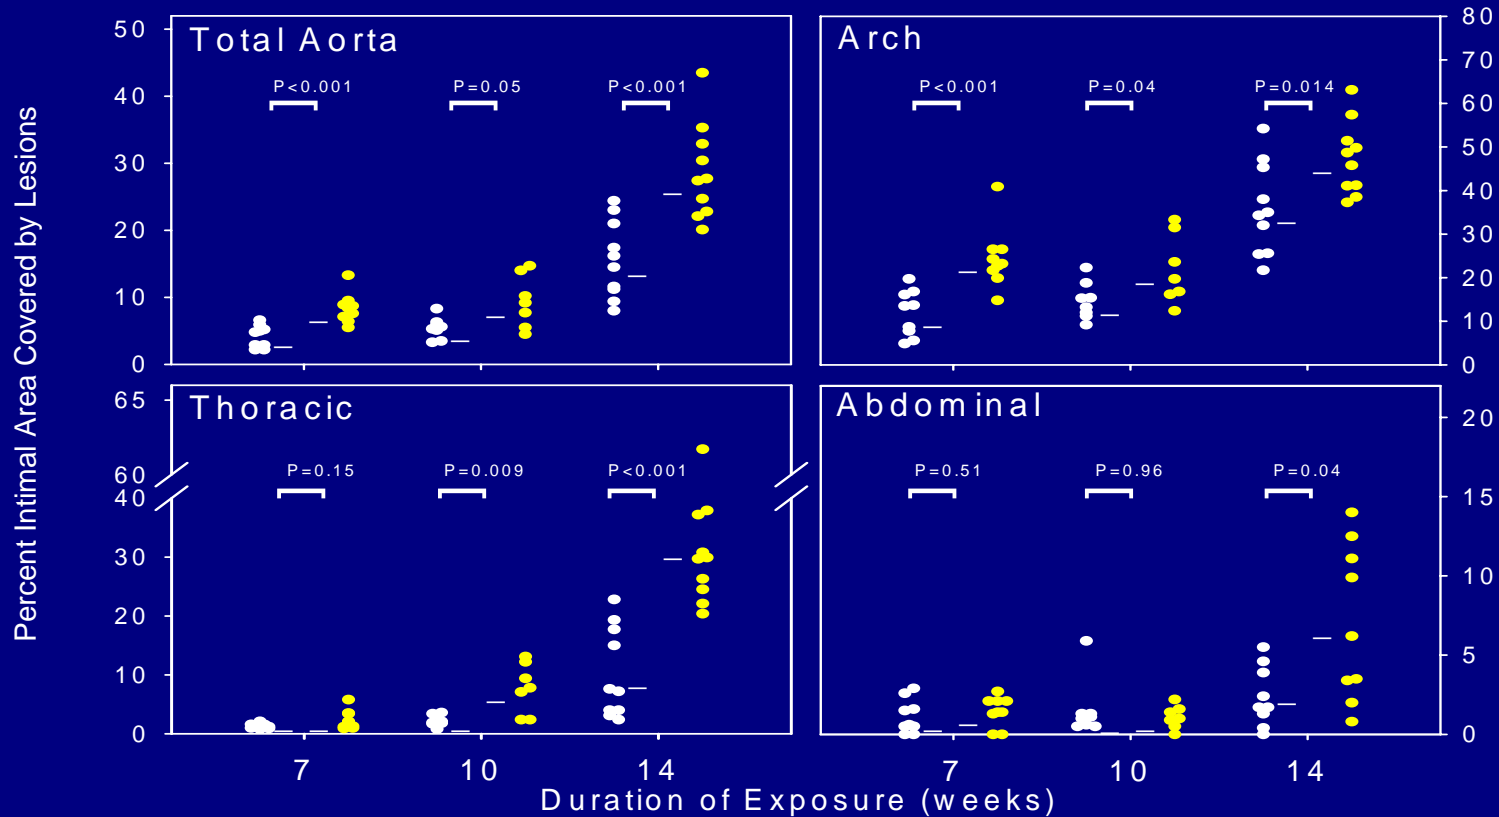

TOTAL AORIC INTIMAL AREA COVERED BY LESIONS

Sham vs Smoke-exposed ApoE^{-/-} Mice

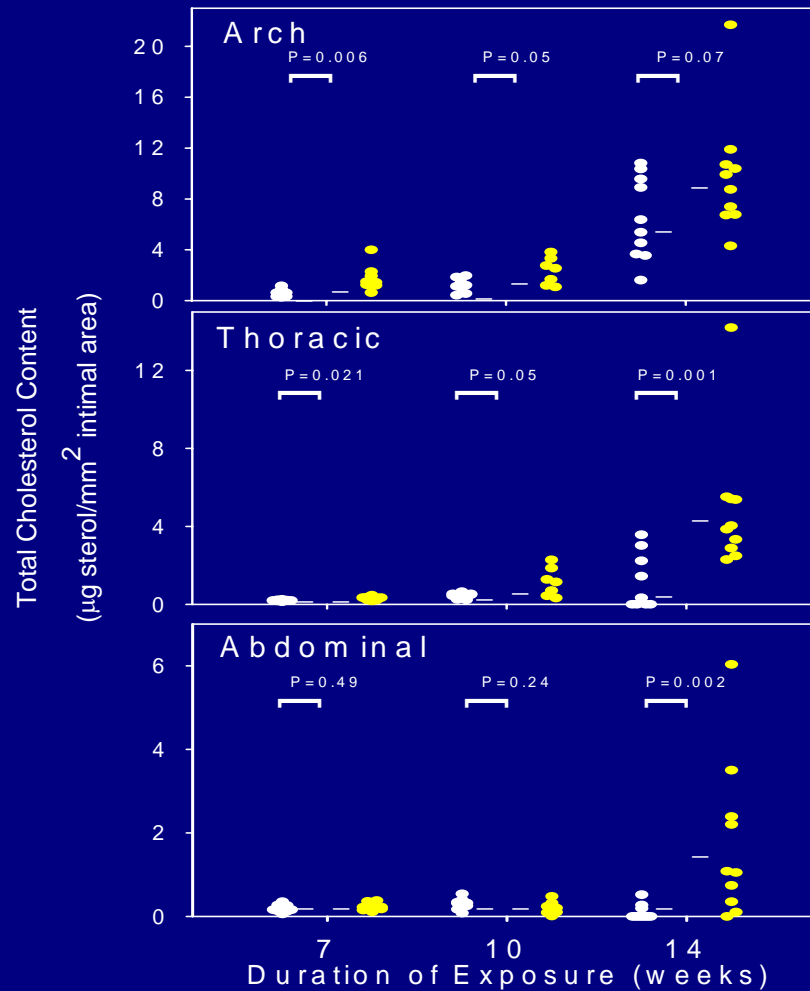

ATHEROSCLEROTIC LESION AREA

Sham vs Smoke-exposed ApoE^{-/-} Mice

AORTIC TISSUE CHOLESTEROL CONTENT

Sham vs Smoke-exposed

Control #11 Aorta 100x Accurate Macrophage 1:1000

Control #11 Aorta 100x No Primary Ab

Smoker #5 Aorta 100x Accurate Macrophage 1:1000

Smoker #5 Aorta 100x No Primary Ab

CIGARETTE MODIFICATION

Plasma Cholesterol of ApoE^{-/-} Mice

Smoke Exposure-12 wks

Atherosclerotic Lesions in ApoE^{-/-} Mice

Smoke Exposure-12 wks

Free Cholesterol in ApoE^{-/-} Mice Vessels

Smoke Exposure-12 wks

Total Cholesterol in ApoE^{-/-} Mice Vessels

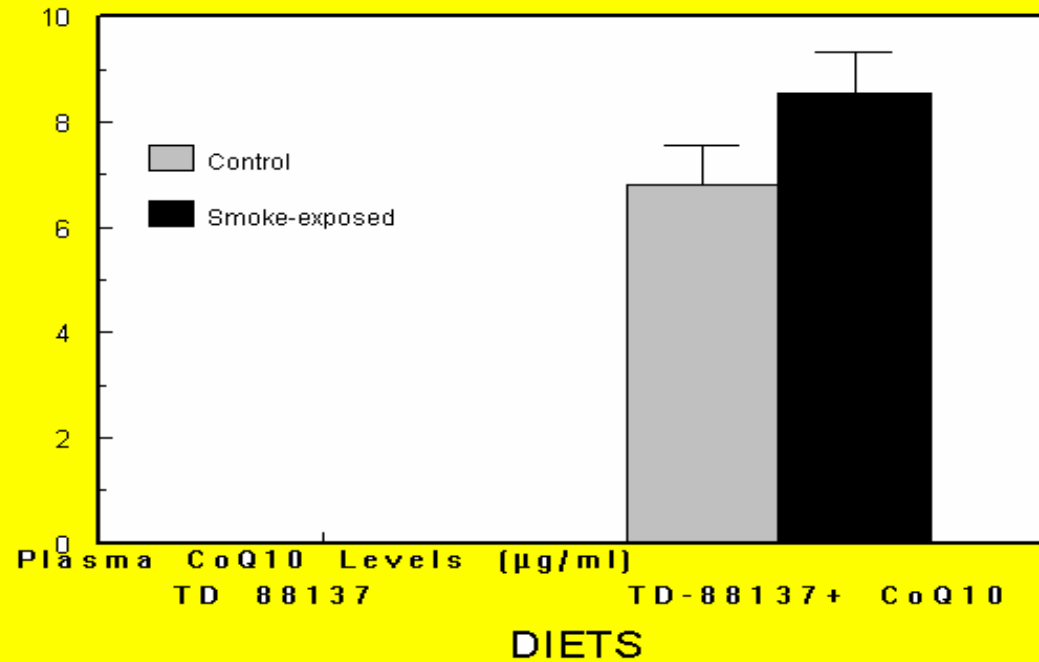

Smoke Exposure-12 wks

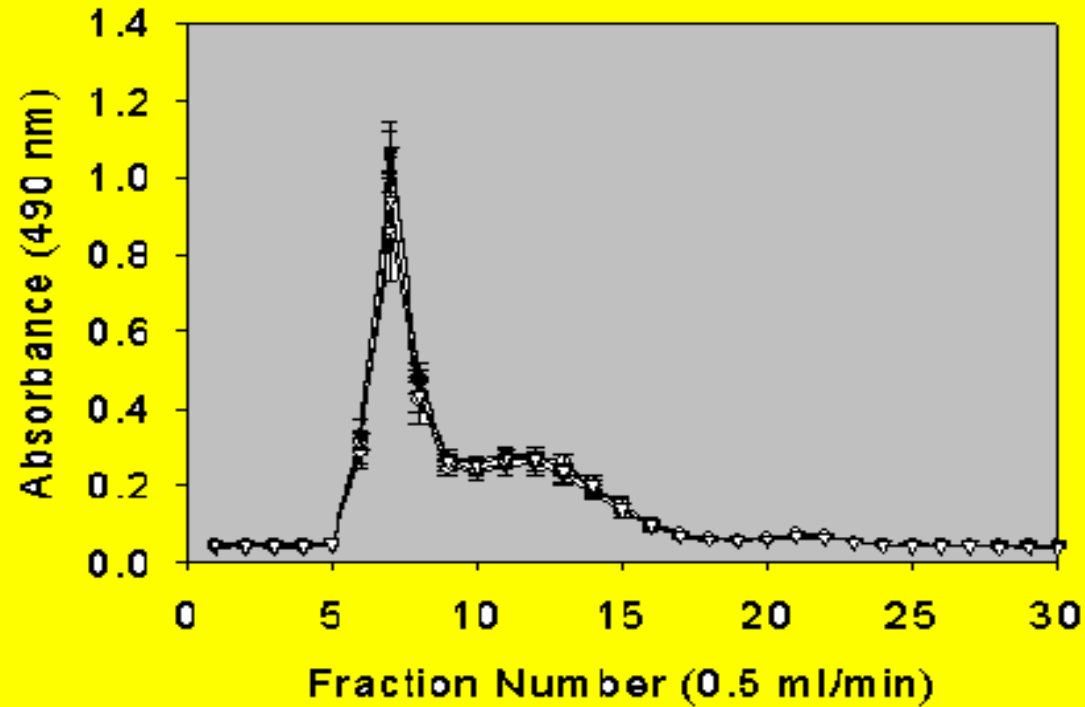

DIETARY INTERVENTION

DIETARY CoQ10 INTERVENTION

Plasma CoQ10 levels in Control and Smoke-exposed
Standard vs CoQ10 supplemented Diets (ExptPM-3)

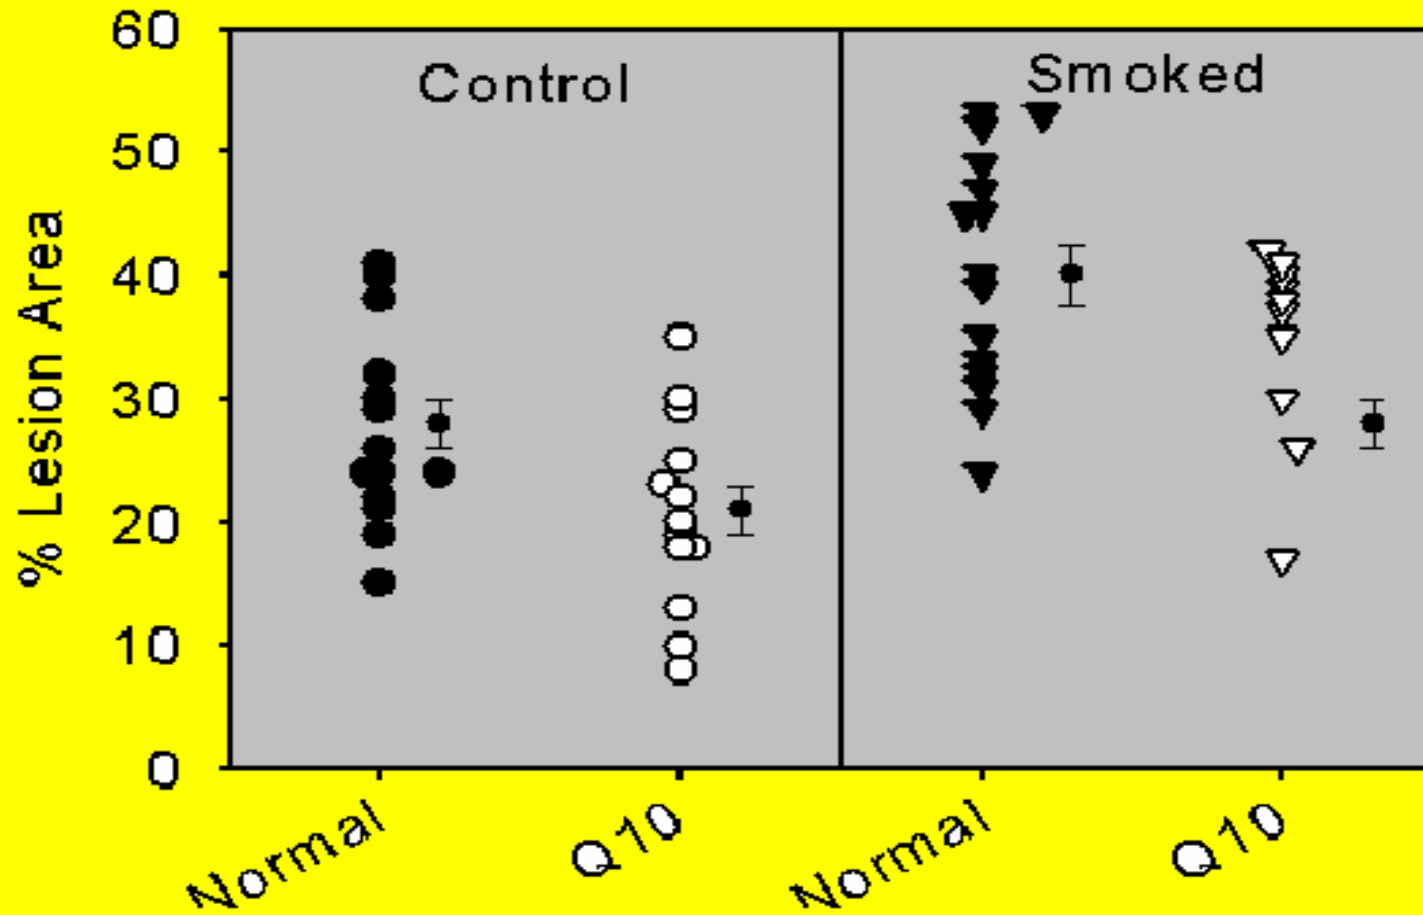

CHOLESTEROL DISTRIBUTION

- control Q10 diet
- smoked Q10 diet
- ▼— control lab diet
- ▽— smoked lab diet

Dietary CoQ10 and Atherosclerosis

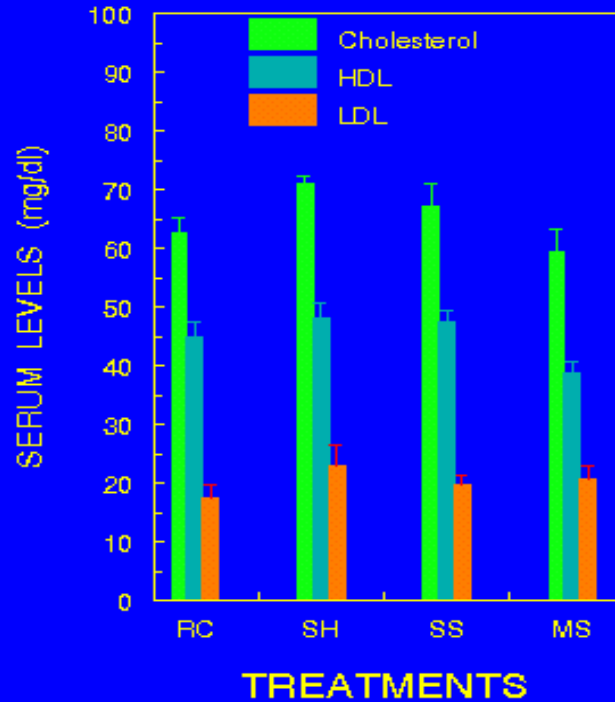

NOSE-ONLY vs WHOLE-BODY

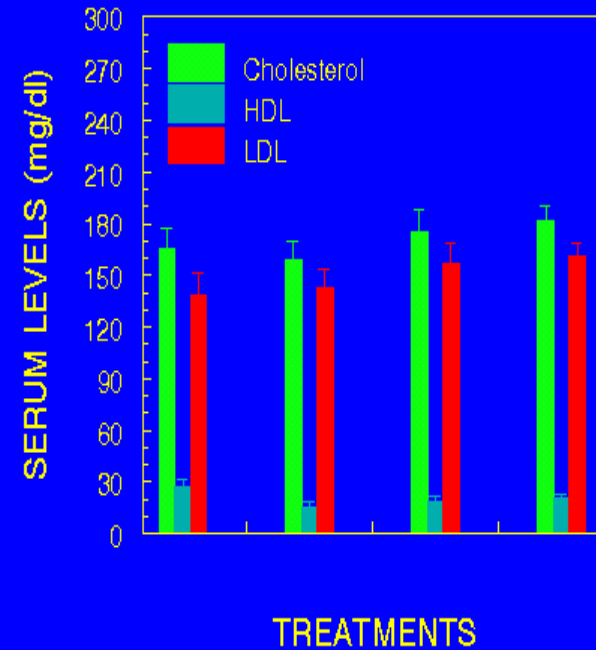

Diet and Cholesterol Distribution

C57BL Mice-Standard and High Cholesterol Diet

STANDARD

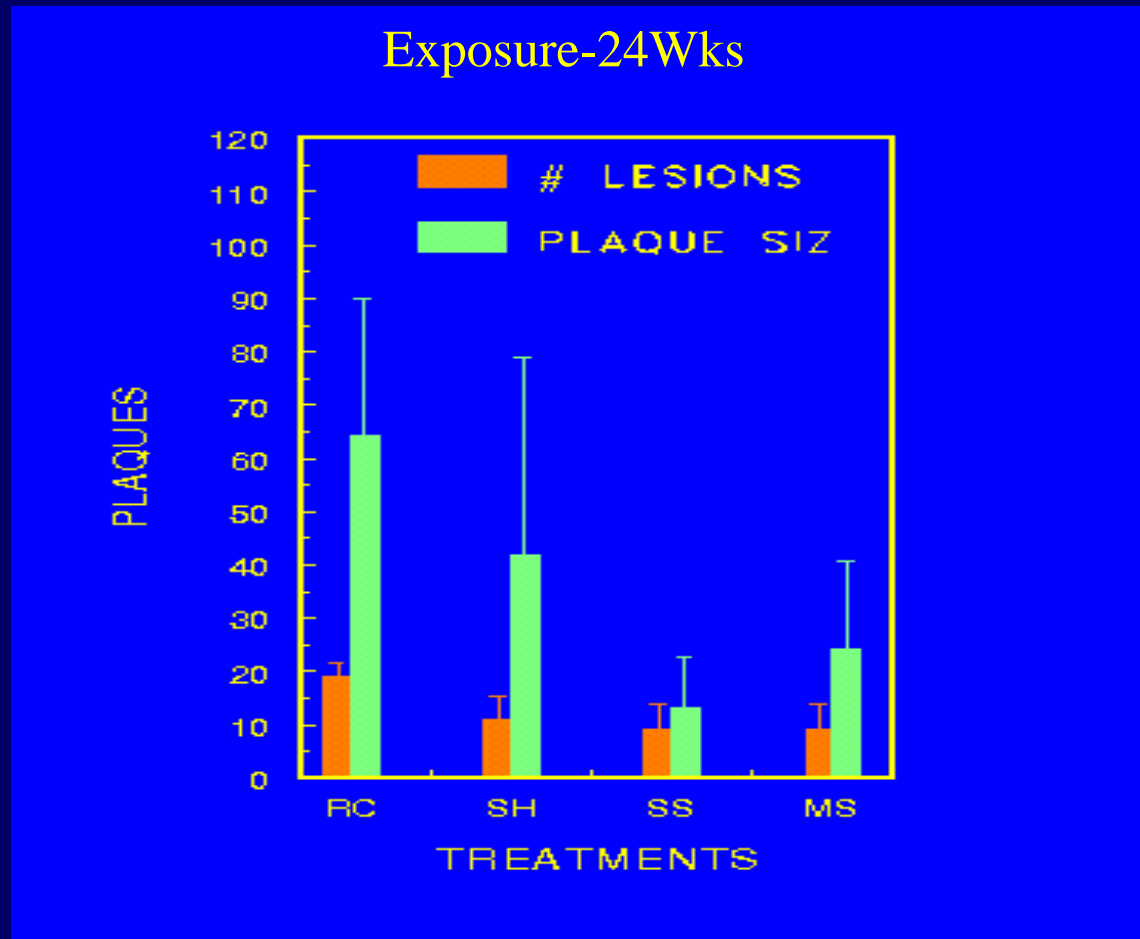

HIGH CHOLESTEROL

SMOKE EXPOSURE AND ATHEROSCLEROSIS

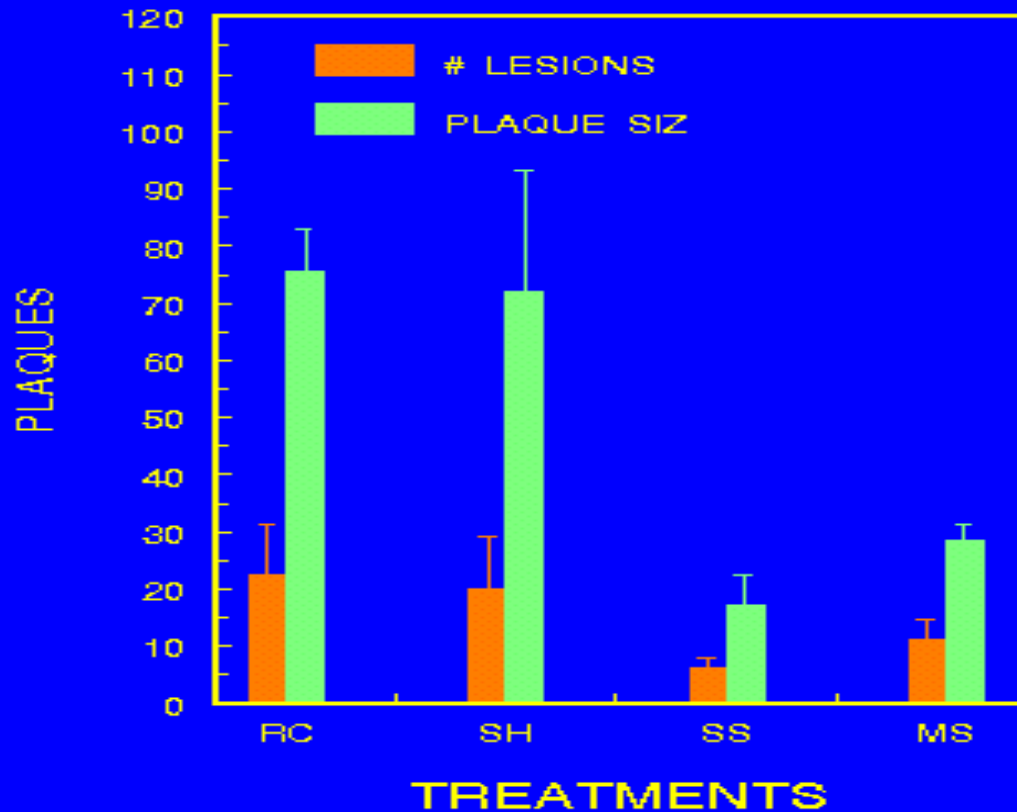

C57B1 Mice-High Cholesterol Diet

SMOKE EXPOSURE AND ATHEROSCLEROSIS

C57B1 Mice-High Cholesterol Diet

Exposure-30Wks

STRENGTHS

- Relevant disease end point
- Quantitative
- Reproducible
- Large data base available

WEAKNESSES

- Thrombosis
- Sites of lesion formation
- Labor-intensive and expensive
- Dose-response not yet established

WHAT IS NEEDED TO STANDARDIZE AND EVALUATE THE ASSAY?

- Dose response --smoke particulates conc.vs disease
--urinary/plasma cotinine vs disease
- Longer exposures --plaque composition and rupture
- Standard vs Western Diet
- Plaque area vs vessel cholesterol
- Whole vs gas phase smoke

Important points Committee needed to be addressed

- Description of the model
- Animal disease endpoints and relevance to human physiology and disease
- Method of exposure and relevance to human exposures
- Reproducibility
- Practicality (sample size/expense/study duration)
- Dose-response
- Significance of observed change in biological response
- Uncertainties and shortcomings
- Overall validity for evaluating claims of reduced risk
- How are doses selected?
- How many animals need to be used?
- How should data be reported/ normalized?
